

Design of Diffractive Beam Splitters for Generating a 2D Light Mark

Abstract

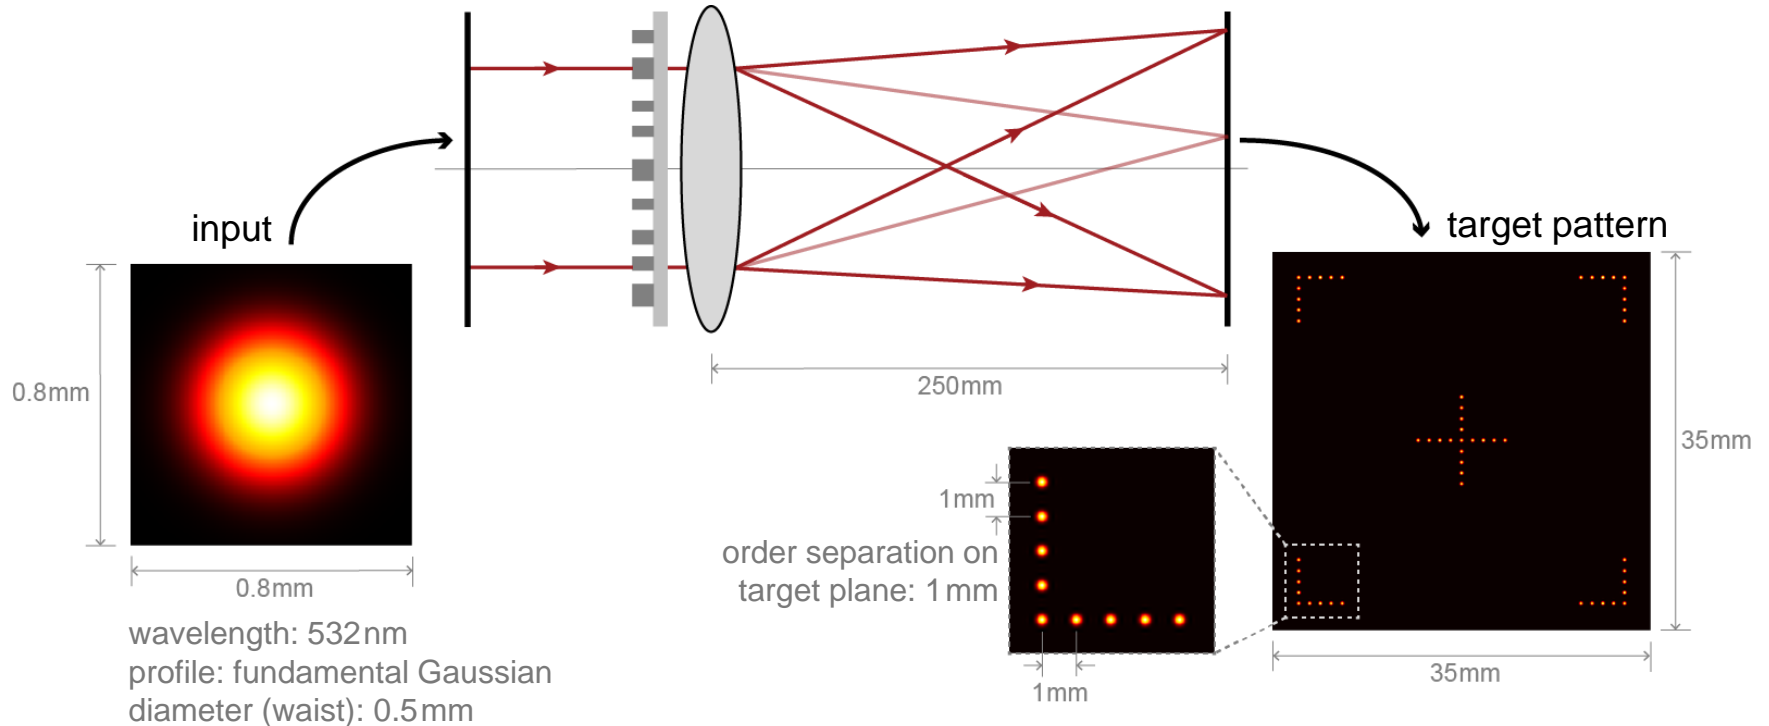

Applications of diffractive beam splitters can be found in e.g. laser material processing, optical metrology, lighting and many more. By using the iterative Fourier transform algorithm (IFTA) in VirtualLab, customized beam splitters can be designed efficiently and flexibly for specific target patterns, like an expected light mark as in this example. Various merit functions are available for the evaluation and further optimization of the designs.

Design Task

How to find a phase-only diffractive beam splitter that generates the desired pattern on the target plane?
(Binary phase is required in this example.)

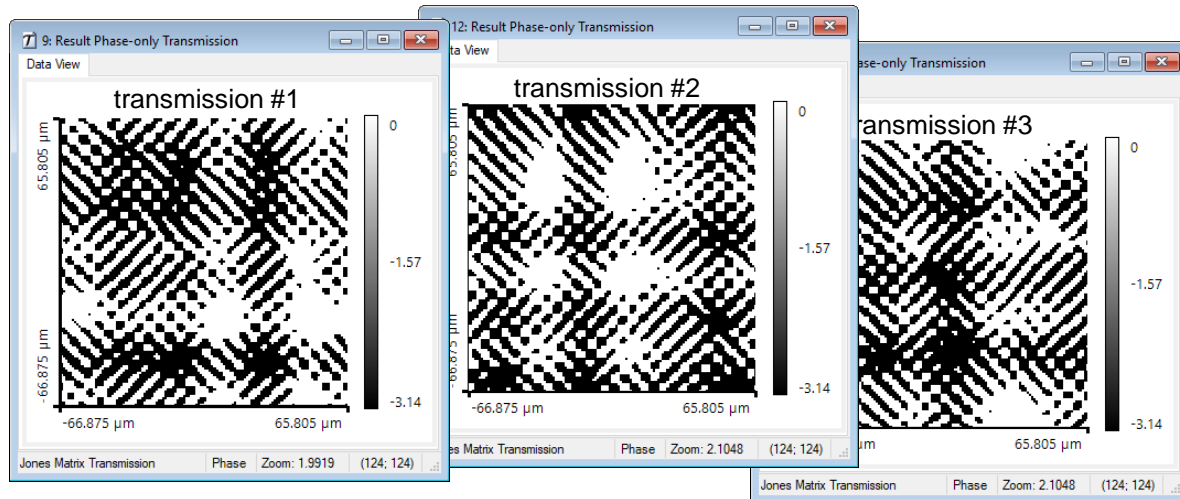

Results

- Designed binary-phase for beam splitter

Beginning with different random phase distributions on the target plane, the iterative Fourier transform algorithm (IFTA) calculates different possible design results.
